Thank you very much for choosing a Grand Seiko watch.
For proper and safe use of your Grand Seiko watch, please read the instructions carefully in this booklet before using it.

Keep this manual handy for easy reference.

Length adjustment service for metallic bands is available at the retailer from whom the watch was purchased.
If you cannot have your watch repaired by the retailer from whom the watch was purchased because you received the watch as a gift, or you moved to a distant place, please contact Grand Seiko international service network mentioned on CERTIFICATE OF GUARANTEE or our website. The service may also be available on a chargeable basis at other retailers, however, some retailers may not undertake the service.

If your watch has a protective film for preventing scratches, make sure to peel it off before using the watch. If the watch is used with the film on it, dirt, sweat, dust, or moisture may be attached to the film and may cause rust.

INTRODUCTION - About mechanical watch -

Thank you very much for purchasing the Grand Seiko mechanical watch.

Take hold of your watch softly.

Hear the watch ticking.

Tick tock, tick tock, tick tock.

Soft and faint, a dignified sound can be heard.

The sound can be called the crystal of the craftsmen’s spirit and skill.

Handpicked parts assembled one by one.

Carefully, with craftsmanship,

Giving life to a mechanical watch.

This is proven by the sound.

Talking about accuracy,

Mechanical watches cannot be compared to quartz watches, that is for certain.

However, the accuracy of a mechanical watch is pursued by human hands.

Full of spirit and know-how of craftsmen.

A mechanical watch - complicated, sensitive, and having a human touch.

We would like to let all of you know the charm of a mechanical watch, which has no bounds.

So we made this handbook, mainly detailing the accuracy.

Wishing you will have a nice time.

With your Grand Seiko for a long, long time.

SEIKO WATCH CORPORATION

Quartz watches and mechanical watches - what is the difference?

We will explain by example.

Quartz watches that you have come to be familiar with.

These are just like airplanes, controlled by computers.

A battery, IC, and crystal make quartz watches work accurately, electrically.

Some loss or gain may occur while the watch is worn.

However, this will be too small to notice in your daily life.

If a quartz watch resembles an airplane, a mechanical watch is like a bicycle.

All watch parts work together mechanically to make it tick.

Thus, a mechanical watch is easily affected by the outside environment.

If it is hot, the watch tends to lose time.

When power driving the watch becomes short (When the amount the spring is wound is short), accuracy becomes unstable.

If the resting position of the watch is changed, accuracy is also affected.

The rate of loss/gain could be significant that you will notice in your daily life.

The accuracy is shown by the daily rate.

The measured loss/gain of the watch per day is called the daily rate.

The accuracy of a mechanical watch is usually shown in this daily rate.

The accuracy of a mechanical watch changes delicately day by day.

Depending on the condition in which the watch is used or the outside environment.

Thus,

By only observing loss/gain in one day, you cannot judge how accurate the watch works.

If you check the average of the daily loss/gain rate, you can judge the accuracy of the watch.

In the case of quartz watches, the accuracy is usually shown by the monthly/yearly rate.

Total losses/gains for a month/year are called the loss/gain rate of quartz watches.
The accuracy of a mechanical watch varies depending on many things, such as the amount the spring is wound by movements of your arm, temperature, or resting position of the watch.

Thus to show the accuracy of a mechanical watch evenly, not depending on the environment, Loss/gain of a mechanical watch is measured. Before the inside movements of the watch are put in the case, under controlled conditions, with many days of tests. And the measured rate is called "the accuracy of mechanical watch movement at rest".

In both the Official Swiss Chronometer Inspectorate and Grand Seiko Standard, the standard rate is the accuracy of mechanical watch movement at rest. *Refer to the instruction manual for further information on the Grand Seiko Standard and Rating Certificate.

This rate is the data measured in an environment that is artificially controlled. In order to fairly evaluate/show the abilities of mechanical watches without being influenced by environmental changes, it is different from "the accuracy of mechanical watches in use" when you are actually wearing the watch.

The accuracy of a mechanical watch varies delicately day by day, depending on the environment. This is like a living thing. One of the charms that a mechanical watch has. The accuracy of a mechanical watch in use should be from –1 second/day to +10 seconds/day (–1 to +8 seconds for Cal. 9S86 and 9S85) /day. If the average of the daily rates exceeds this level, we would like the responsibility for adjusting it accordingly. [Only in Japan]. The cost of adjusting the watch is free of charge for three years from the date of purchase.

To adjust the accuracy as accurately as possible, information such as the rate of loss/gain of your watch and how you use it, is very important. Please let us know the following information when you ask for adjustment of your watch by our service center.

1. The average daily loss/gain rates for one week to ten days Ex. an average of +11 seconds
2. Approximate hours of wearing the watch in one day in the above period Ex. Approximately 10 hours
3. The resting position of the watch while you don’t wear it Ex. Horizontal - Dial up Vertical - the crown up

For lifelong use of your mechanical watch: rule No.1

Wind the mainspring of your mechanical watch at a fixed time.

As there are rules for everything.
There is a rule for winding the spring.
You have not heard this before? Please keep it in mind.

The mainspring - the source of energy for a mechanical watch.
When it is fully wound, it can supply the most stable energy to every part of the watch movement, and the accuracy of the watch becomes most stable.

Even if your watch is a self-winding type, when you feel the accuracy is not stable, shake the watch or turn the crown about thirty times to wind the mainspring further. If you work at a desk, etc., and do not move too much, the spring will not be wound sufficiently.

For instance, you may make it a rule to wind the spring when you wake up, or at lunchtime.

For lifelong use of your mechanical watch: rule No.2

Place your watch correctly, like this.

Half of one day, twenty-four hours
When you do not wear your watch. The accuracy while you do not wear the watch is included in "the accuracy of a mechanical watch in use".

The mechanical watch that you take off.
Which position should the watch be put in?

The loss/gain of a mechanical watch depends on the resting position of the watch. In one position, the watch tends to gain, in another position, it doesn't.

For instance, while you are sleeping at night, when you do not wear your watch, put the watch in various positions for seven to eight hours, such as placing it with its face turned up, or with the crown up. To find the best resting position for the watch for reducing the loss/gain that occurs while you are wearing your watch.
A piece of metal of about 0.1 mm, as thin as a hair, is wound. That is the key that controls the accuracy of all mechanical watches. Metals expand and contract depending on the temperature. This characteristic of all metals also applies to the hairspring. This affects the accuracy of a mechanical watch.

In other words, when it is hot, the hairspring expands and the watch tends to lose. When it is cold, the hairspring contracts and the watch tends to gain. This is typical. Accuracy will vary depending on the temperature.

Metals expand and contract depending on the temperature. This characteristic of all metals also applies to the hairspring. This affects the accuracy of a mechanical watch.

In other words, when it is hot, the hairspring expands and the watch tends to lose. When it is cold, the hairspring contracts and the watch tends to gain. This is typical.

CAUTIONS FOR ACCURACY

○ Normal usage accuracy of a mechanical watch varies depending on individual customer's use conditions such as winding state of the mainspring by movement amount of the customer's arm per day, temperature environment, and posture (direction of the watch). Accordingly, the actual normal usage accuracy when the watch is used by a customer may differ from the numerical value of each item specified in the Grand Seiko Standard.

○ The target range of normal usage accuracy when the watch is actually used by a customer is set to –1 to +10 seconds (in the case of Cal. 9S86 and 9S85, -1 to +8 seconds) per day.

To correctly judge the normal usage accuracy, please use the watch for not only one day, but also approximately one week to 10 days under normal use conditions to check loss or gain of time. If the average value per day exceeds the target range, we will adjust the watch. (Adjustment is provided Free of charge for three years after purchase, then charged thereafter. For more details, please refer to the instruction manual.)

○ The enclosed Grand Seiko Standard Inspection Certificate certifies the values of a movement single unit before assembly in a case which are measured under an artificially controlled environment in the production factory passed the Grand Seiko standard inspection. Should the certificate be lost or after repair or adjustment, it cannot be reissued.

HANDLING CAUTIONS

WARNING

To indicate the risks of serious consequences such as severe injuries unless the following safety regulations are strictly observed.

Immediately stop wearing the watch in the following cases.

○ If the watch body or band becomes edged by corrosion etc.
○ If the pins protrude from the band.
※ Immediately consult the retailer from whom the watch was purchased or Grand Seiko international service network mentioned on CERTIFICATE OF GUARANTEE or our website.

Keep the watch and accessories out of the reach of babies and children.

Care should be taken to prevent a baby or a child accidentally swallowing the accessories. If a baby or child swallows the battery or accessories, immediately consult a doctor, as it will be harmful to the health of the baby or child.

CAUTIONS

To indicate the risks of light injuries or material damages unless the following safety regulations are strictly observed.

Avoid wearing or storing the watch in the following places.

○ Places where volatile agents (cosmetics such as polish remover, bug repellent, thinners etc.) are vaporizing
○ Places where the temperature drops below 5 ºC or rises above 35 ºC for a long time
○ Places of high humidity ○ Places affected by strong magnetism or static electricity
○ Dusty places ○ Places affected by strong vibrations

If you observe any allergic symptoms or skin irritation
Stop wearing the watch immediately and consult a specialist such as a dermatologist or an allergist.

Other cautions

○ Replacement of the metal band requires professional knowledge and skill. Please ask the retailer from whom the watch was purchased for replacement of the metal band, as there is a risk of hand or finger injury and fear of losing parts.
○ Do not disassemble or tamper with the watch.
○ Keep the watch out of the reach of babies and children. Extra care should be taken to avoid risks of any injury or allergic rash or itching that may be caused when they touch the watch.
○ If your watch is of the fob or pendant type, the strap or chain attached to the watch may damage your clothes, or injure the hand, neck, or other parts of your body.
○ Please keep in mind that if a watch is taken off and placed down as it is, the case back, the band and the clasp will rub against each other possibly causing scratches on the case back. We recommend placing a soft cloth between the case back, the band and the clasp after taking off your watch.
**CHECK THE CALIBER NUMBER AND WATER-RESISTANT LEVEL**

**About the caliber number**
The caliber number is a four-digit number that indicates the model of a movement (mechanical part of a watch). The Grand Seiko watch is mounted with an exclusive caliber. The mechanical caliber number starts with “9S”, the spring drive caliber number starts with “9R” and the quartz caliber number starts with “9F” and “4J”.

**How to check the caliber number**
The four-digit model number on the case back is the caliber number.

<Regular case back>  <See-through case back>  <Diver’s watch case back>

---

**Water resistance**
Refer to the table below for the description of each degree of water resistant performance of your watch before using.

<table>
<thead>

---

**CAUTIONS ON WATER RESISTANCE**

**CAUTIONS**

Do not turn or pull out the crown when the watch is wet.
Water may get inside of the watch.
※ If the inner surface of the glass is clouded with condensation or water droplets appear inside of the watch for a long time, the water resistant performance of the watch is deteriorated. Immediately consult the retailer from whom the watch was purchased or Grand Seiko international service network mentioned on CERTIFICATE OF GUARANTEE or our website.

Do not leave moisture, sweat and dirt on the watch for a long time.
Be aware of a risk that a water resistant watch may lessen its water resistant performance because of deterioration of the adhesive on the glass or gasket, or the development of rust on stainless steel.

Do not wear the watch while taking a bath or a sauna.
Steam, soap or some components of a hot spring may accelerate the deterioration of water resistant performance of the watch.

---

If water-resistant level of your watch is defined as “WATER RESISTANT”

**WARNING**

Do not use the watch in scuba diving or saturation diving.
The various tightened inspections under simulated harsh environment, which are usually required for watches designed for scuba diving or saturation diving, have not been conducted on the water-resistant watch with the BAR (barometric pressure) display. For diving, use special watches for diving.

**CAUTION**

Do not pour running water directly from the faucet.
The water pressure of tap water from a faucet is high enough to degrade the water resistant performance of a water resistant watch for everyday life.
If water-resistant level of your watch is defined as “AIR DIVER’S”

⚠️WARNING
- Never use the watch in saturation diving using helium gas.
- While diving, never operate the watch in any other manner than described in this instruction manual.

⚠️CAUTION
Before using the diver’s watch, you have to be properly trained in various types of diving and possess the requisite experience and skill to dive safely. When diving, strictly abide by the rules of diving.

If water-resistant level of your watch is defined as “He-GAS DIVER’S”

⚠️WARNING
- This product is compatible with saturation diving. Do not use this product for saturation diving unless you have acquired the requisite experience and techniques for safe saturation diving, thoroughly familiarized yourself with the operation and handling of this product, and inspect all functions of this product prior to each dive.
- Make sure you carefully check the depth rating indicated on the watch dial or the case back, and never use the watch underwater deeper than the specified depth.
- While diving, never operate the watch in any other manner than set forth in the instruction manual.

⚠️CAUTION
Before using the diver’s watch, you have to be properly trained in various types of diving and possess the requisite experience and skill to dive safely. When diving, strictly abide by the rules of diving.

### Precautions for diving

**Before diving**
Inspect the following items before diving.
⇒ *NAMES OF THE PARTS* page 15.

1. The time is correctly set.
2. Turn the crown to wind up the watch.
   - “Screw lock type crown” → page 17
   - “How to use the automatic mechanical watch” → page 18
3. The rotating bezel turns smoothly.
   (The bezel rotation must not be too loose or too tight.)
   ⇒ “Unidirectional rotating bezel” page 30.
4. The crown is completely screwed in.
   ⇒ “Screw-lock type crown” page 17.
5. No abnormalities such as flaws or cracks exist on the band or glass.
6. The band is reliably fixed with spring bars, buckles or other parts.

⚠️ CAUTION
If you notice any abnormalities, contact the retailer from whom the watch was purchased or Grand Seiko international service network mentioned on CERTIFICATE OF GUARANTEE or our website.
While diving

Make sure to observe the following instructions when you wear the watch while diving.

- Wear the watch within the water depth indicated on the dial.
- Do not operate the crown or buttons underwater.
- Take care not to bump the watch against hard objects such as rocks.
- Bezel rotation may become slightly harder underwater, but this is not a malfunction.

After diving

Please follow the care instructions below after diving.

- Rinse the watch in fresh water and wipe it thoroughly dry.
- Do not pour running water directly from a faucet onto the watch.
- Soak the watch in a container filled with water to wash it.

NAMES OF THE PARTS

9S85, 9S68, 9S65 (Regular models)

- Hour hand
- Minute hand
- Second hand
- Date

9S85 (Diver’s models)

- Hour hand
- Minute hand
- Second hand
- Date

⇒ "How to set the time" page 19.
⇒ "FUNCTIONS OF DIVER’S MODEL" page 30.
⇒ "Precautions for diving" page 13.
There are two types of crowns, a normal crown and a screw-lock crown.

**Normal crown**
- Pull out the crown and operate it.

**Screw-lock type crown**
- Unlock the crown before operating it.
- After operating the crown, lock it.

- By locking the crown by screw, a screw-lock type crown can prevent malfunction and increase water resistance.
- Be careful not to screw the crown in by force as it may damage the slots of the crown.
  - When locking the crown, turn it slowly with care, ensuring that the screw is properly engaged.
  - Be careful not to push it in forcefully, as doing so may damage the screw hole in the case.

- It cannot be turned any further.
- It is necessary to unlock the screw-lock type crown before operating it.
- Once you have finished operating the crown, make sure to relock it.

**HOW TO USE CROWN**

**Normal crown**
- While pressing the crown in, turn it in the direction indicated by the arrow.

**Screw-lock type crown**
- While pressing the crown in, turn it clockwise (upward) while gently pressing it in toward the watch body until it stops.

- While pressing the crown, screw.

- Turn the crown counterclockwise (downward) to unscrew it. Now the crown can be operated.
HOW TO USE (FOR CAL. 9S85, 9S68, 9S65)

How to wind the mainspring

○ This watch is an automatic winding type (with manual winding function).
○ The mainspring can be sufficiently wound automatically by natural movement of the arm while normally worn on the wrist. In addition, it can be wound by turning the crown.
○ A stopped watch can be started by arm movement when it is worn on the wrist, however, before wearing the watch, wind the mainspring sufficiently and adjust the time and date. When turning the mainspring, turn the crown at the normal position clockwise (12 o’clock direction) slowly. If you turn the crown counterclockwise (6 o’clock direction), it will turn free. The mainspring is sufficiently wound when the crown is turned approximately 45 times (60 times for Cal. 9S68, 9S65). When the mainspring is in the full-winding state, it is structured so that the mainspring slips if it is wound. Therefore, it is not necessary to worry about cutting the mainspring, however, please refrain from excessive operation.

※ It is recommended that you wear the watch on your wrist more than 10 hours a day to keep the mainspring wound up. If the mainspring is not wound up sufficiently, the watch may lose or gain time. If you do not wear the watch on your wrist, wind the mainspring up sufficiently by turning the crown by hand every day at a fixed time.

CAUTION

○ Do not adjust the date between 10 o’clock p.m. and 1 o’clock a.m. If the date is adjusted during this period of time, the date may not change when the next day comes, or this may cause damage.
○ Due to its wheel train mechanism, for setting the time of the mechanical watch correctly, the hands should be set back once slightly and then set forward to the correct time.

How to set the time and date

This watch is equipped with the date display function. The date changes once every 24 hours at around 12 o’clock a.m. Therefore, if the a.m./p.m. is incorrectly set, the date will change around 12 o’clock p.m.
① Pull out the crown to the first click. (If the watch is equipped with the screw lock type crown, unscrew the crown before pulling it out.)
② The date can be adjusted by turning the crown clockwise (12 o’clock direction). First turn the crown clockwise until the previous day’s date from the desired date appears.
【Ex.】If you want to set the date to "6," set the date to "5" by turning the crown clockwise.
③ Pull out the crown to the second click when the second hand is at the 12 o’clock position. (The second hand stops.) Turn the crown clockwise until the desired date appears. When the date changes, the time is a.m. Further turn the crown to set the current time.
④ Push the crown back into the normal position in accordance with a time signal. The watch starts operating.

Date adjustment at the end of the month

It is necessary to adjust the date after February (which has 28 days, 29 days in a leap year) and a 30 day month.
【Ex.】To adjust the date in the a.m. period on the first day of a month following a 30-day month
On the first day, "31" is displayed. Pull out the crown to the first click. Turn the crown clockwise to set the date to "1", and push the crown back in to the normal position.

CAUTION For models with a screw lock type crown, remember to screw the crown in.
HOW TO USE (FOR CAL. 9S86, 9S66)

How to wind the mainspring

○ This watch is an automatic winding type (with manual winding function).
○ The mainspring can be sufficiently wound automatically by natural movement of the arm while normally worn on the wrist. In addition, it can be wound by turning the crown.
○ A stopped watch can be started by arm movement when it is worn on the wrist, however, before wearing the watch, wind the mainspring sufficiently and adjust the time and date. When turning the mainspring, turn the crown at the normal position clockwise (12 o’clock direction) slowly. If you turn the crown counterclockwise (6 o’clock direction), it will turn free. The mainspring is sufficiently wound when the crown is turned approximately 45 times (60 times for Cal. 9S66). When the mainspring is in the full-winding state, it is structured so that the mainspring slips if it is wound. Therefore, it is not necessary to worry about cutting the mainspring, however, please refrain from excessive operation.

※ It is recommended that you wear the watch on your wrist more than 10 hours a day to keep the mainspring wound up. If the mainspring is not wound up sufficiently, the watch may lose or gain time. If you do not wear the watch on your wrist, wind the mainspring up sufficiently by turning the crown by hand every day at a fixed time.

How to set the time and calendar

○ To set the time and calendar, set the 24-hour hand and minute hand first, and then set the hour hand and calendar.
○ When setting the time, make sure that the mainspring is sufficiently wound.

How to set the time

① Make sure that the mainspring is sufficiently wound and the watch is working.
※ When setting the date and time, ensure that the watch is working.

② Unlock the crown.
⇒ “How to use the screw lock type crown” page 17.

③ Pull out the crown to the second click when the small second hand is pointing at the "0" second position. The small second hand will stop on the spot.

④ Turn the crown to rotate the 24-hour hand and minute hand clockwise and set them to the current time. While doing so, set the minute hand a few minutes behind the correct time, and then slowly advance it to the desired time.
※ Only the 24-hour and minute hands are to be set first. Even if the hour hand is indicating incorrect time, or the date may be altered depending on the position of the hour hand, it is not necessary to make an adjustment at this stage.

⑤ Push the crown back in simultaneously with the time signal.
※ The setting of the 24-hour, minute and small second hands to the current time is now completed.

⑥ To move on to the hour hand and calendar setting, pull the crown out to the first click.

⑦ Turn the crown to set the hour hand. While turning the crown, the moment the date changes is midnight. When setting the hour hand, be sure that AM/PM is set correctly. Adjust the calendar also at this point if necessary.
※ The crown can be turned in either direction to adjust the date, however, it is recommended to turn the crown in the direction which enables you to set the date with a smaller adjustment.
※ Turn the crown slowly, checking that the hour hand moves in one-hour increments.
※ When adjusting the hour hand, the other hands may move slightly. However, this is not a malfunction.

⑧ Push the crown back in to complete the time setting. Relock the crown.
⇒ “How to use the screw lock type crown” page 17.
How to set the calendar
Two full rotations of the hour hand will change the date for one day. The date advances one day by turning the hour hand two full rotations clockwise (for 24 hours), while the date is set back one day by turning the hour hand two full rotations counterclockwise.
※ Manual date adjustment is required on the first day after a month that has less than 31 days: February, April, June, September and November.

1. Make sure that the mainspring is sufficiently wound and the watch is working.
※ When setting the date and time, ensure that the watch is working.

2. Unlock the crown.
⇒ "How to use the screw lock type crown" page 17.

3. Pull out the crown to the first click.

4. Each time the hour hand makes two full rotations by turning the crown, the date is adjusted one day. While turning the crown, the moment the date changes is midnight. When setting the hour hand, be sure that a.m./p.m. is set correctly.

5. Upon completion of setting, make sure that the time indicated is correct, and then push the crown back in. The calendar setting is now completed. Relock the crown.
⇒ "How to use the screw lock type crown" page 17.

※ The calendar is designed to work in conjunction with the movement of the hour hand, therefore, incorrect setting of a.m./p.m. will cause the date to change at noon.
※ The crown can be turned in either direction to adjust the date, however, it is recommended to turn the crown in the direction which enables you to set the date with a smaller adjustment.
※ Turn the crown slowly, checking that the hour hand moves in one-hour increments.
※ When adjusting the hour hand, the other hands may move slightly. However, this is not a malfunction.

How to use the 24-hour hand
This watch has two different types of 24-hour hand usage.

<Type 1> 24-hour hand as an a.m./p.m. indicator
Simply using the 24-hour hand to show the 24-hour time as an a.m./p.m. indicator. (This is the standard usage type for the 24-hour hand.)

Both the hour hand and the 24-hour hand are indicating the Japan time 10:00 a.m.

Turning the crown clockwise (upward):
Each time the hour hand makes two full rotations, the date is advanced one day.
※ The crown can be turned in either direction to adjust the date, however, it is recommended to turn the crown in the direction which enables you to set the date with a smaller adjustment.
※ Turn the crown slowly.
※ When adjusting the hour hand, the other hands, the other hands may move slightly. However, this is not a malfunction.

Turning the crown counterclockwise (downward):
Each time the hour hand makes two full rotations, the date is set back one day.

<Type 2> 24-hour hand as a dual time indicator
Using the time difference adjustment function, set the 24-hour hand to indicate a time different from the time that the hour and minute hand indicate, which is of a place in a different time zone area with at least one hour of time difference from where you are.

Hour hand: Japan time 10:00 a.m.
24-hour hand: New York time 8:00 p.m.
Time difference adjustment function
For example, while traveling abroad and staying in a place with a different time from where you live, you can conveniently set the watch to indicate the local time in the different time zone area without stopping the watch. The hour hand indicates the time of the place where you currently are, while the 24-hour hand indicates the time of the place of origin. The calendar works in conjunction with the movement of the hour hand. If the time difference is correctly adjusted, the watch displays the correct date of the place where you are staying.

How to use the time difference adjustment function

① Make sure that the mainspring is sufficiently wound and the watch is working.
※ When setting the hour hand to use the time difference adjustment function, ensure that the watch is working.

② Unlock the crown.
⇒ "How to use the screw lock type crown" page 17.

③ Pull out the crown to the first click.

④ Turn the crown to set the hour hand to indicate the time of the place where you are staying. Make sure that a.m./p.m. and date are correctly set.
※ The calendar is designed to work in conjunction with the movement of the hour hand, therefore, incorrect setting of a.m./p.m. will cause the date to change at noon.
⇒ "List of time zone differences in major regions of the world" page 26.

⑤ Upon completion of setting, make sure that the time indicated is correct, and then push the crown back in. The setting procedure is now completed. Relock the crown.
⇒ "How to use the screw lock type crown" page 17.
※ If you set the time during any time between 9:00 p.m. and 1:00 a.m., temporarily set the hour hand back to 8:00 p.m., and then set the time.

Selectable display mode
With the time difference adjustment function, the watch features a dual time display which shows time in two different time zones. It offers two display modes which you can select to suit your needs and preference.

⑥ Set the 24-hour hand first, and then set the hour hand.

【Ex.1】
Hour hand and calendar: Area A (Japan)
24-hour hand: Area B (New York)
Set the 24-hour hand first, and then set the hour hand.

【Ex.2】
Hour hand and calendar: Area B (New York)
24-hour hand: Area A (Japan)

### HOW TO USE (FOR CAL. 9S64)

#### How to wind the mainspring

- This watch is a manual winding type.
- In order to wind it up completely, please refer to the following table:

<table>
<thead>
<tr>
<th>In case the watch is supposed to be wound up every day.</th>
<th>About 20 turns of the crown will wind up the watch fully.</th>
</tr>
</thead>
<tbody>
<tr>
<td>In case the watch was not wound up more than three days.</td>
<td>About 60 turns of the crown will wind up the watch fully.</td>
</tr>
</tbody>
</table>

- From the state of the mainspring being sufficiently wound, it continuously operates for approximately 72 hours or more.
- If the mainspring is not wound up sufficiently, the watch may lose or gain time.
- To attain a high accuracy, we suggest that the mainspring is wound up fully once a day at a fixed time.

- Generally speaking, the crown of the manual winding mechanical watch cannot be turned further when it is wound up fully. However, the crown of CAL. 9S64 can be turned endlessly even after the watch is fully wound up. If you keep turning the crown, that gives no effect to winding, but the watch is so designed as to make the winding a little tighter and not to damage the watch. However, please refrain from excessive operation.

- When the watch is used from a state in which the mainspring is unwound to a stop, it does not move immediately even if the mainspring is wound with the winding crown. This is because of the mechanical watch’s feature that the mainspring torque (force) is weak at the beginning of mainspring winding. The second hand starts moving when the mainspring is wound to reach a certain degree of torque strength, while the watch can be made to move advance by shaking it to rotate the balance wheel forcibly.

#### Do not pull out the crown.

(If the watch is equipped with the screw lock type crown, unscrew the crown before pulling it out.)

Slowly turn the crown clockwise (12 o’clock direction) to wind the mainspring.

---

**CAUTION** For models with a screw lock type crown, remember to screw the crown in.
How to set the time

① Pull out the crown when the second hand is at the 12 o’clock position.
(The second hand stops.)
Turn the crown to set the current time.

② Push the crown back in to the normal position in accordance with a time signal.
The watch starts operating.

HOW to USE (FOR CAL. 9S61)

How to wind the mainspring

○ This watch is an automatic winding type (with manual winding function).
○ The mainspring can be sufficiently wound automatically by natural movement of the arm while normally worn on the wrist. In addition, it can be wound by turning the crown.
○ A stopped watch can be started by arm movement when it is worn on the wrist, however, before wearing the watch, wind the mainspring sufficiently and adjust the time and date. When turning the mainspring, turn the crown at the normal position clockwise (12 o’clock direction) slowly. If you turn the crown counterclockwise (6 o’clock direction), it will turn free. The mainspring is sufficiently wound when the crown is turned approximately 60 times. When the mainspring is in the full-winding state, it is structured so that the mainspring slips if it is wound. Therefore, it is not necessary to worry about cutting the mainspring, however, please refrain from excessive operation.

※ It is recommended that you wear the watch on your wrist more than 10 hours a day to keep the mainspring wound up. If the mainspring is not wound up sufficiently, the watch may lose or gain time. If you do not wear the watch on your wrist, wind the mainspring up sufficiently by turning the crown by hand every day at a fixed time.

CAUTION

○ For models with a screw lock type crown, remember to screw the crown in.
○ Due to its wheel train mechanism, for setting the time of the mechanical watch correctly, the hands should be set back once slightly and then set forward to the correct time.

How to set the time

① Pull out the crown when the second hand is at the 12 o’clock position.
(The second hand stops.)
Turn the crown to set the current time.

② Push the crown back in to the normal position in accordance with a time signal.
The watch starts operating.
FUNCTIONS OF DIVER’S MODEL

Unidirectional rotating bezel

By using the rotating bezel, you can measure the elapsed time since the start of an event or an activity such as diving.

This watch has a unidirectional rotating bezel. As the evaluation of the remaining air in your cylinder is based on the information of the elapsed time of the dive, the rotating bezels for a diver’s watch is designed to rotate only counterclockwise, so that the watch is prevented from displaying the elapsed time shorter than it actually is.

⚠️ CAUTION

Make sure that you check the correct remaining amount of air in your cylinder before diving. Use the display of the elapsed time by the rotating bezel only as a guide during diving.

How to use the rotating bezel

① At the start of the activity, for which you want to measure the elapsed time (for example, when you start diving), rotate the bezel so that the ▽ mark on the bezel is aligned with the minute hand.
② Read the graduation on the rotating bezel to which the minute hand is pointing.

[Ex.] When you start diving at 10:10.

Start of the dive

Rotating direction of the bezel

Align the ▽ mark with the minute hand

After 15 minutes has elapsed

Read the graduation on the rotating bezel to which the minute hand is pointing.

Elapsed time

Diver adjuster

If your watch has a metal bracelet equipped with a diver adjuster mechanism, you can easily adjust the bracelet length by yourself. This is very useful when you wear the watch over a wetsuit or a heavy winter clothing.

How to use the diver adjuster

① Lift up the flap approximately 90° and press it down further approximately 20°, and hold it there.
※ You may feel slight resistance, but doing this requires only a light force. Please do not push the flap down forcibly.
② Lightly pull the bracelet on the 6 o’clock side of the watch along the curved line of the bracelet.
※ Again, doing this requires only a light force. Please do not pull the bracelet forcibly.
※ The slider can be pulled out approximately 30 mm. Be careful not to pull it out beyond the limit mark inscribed on it.

③ Holding down the push button, lift up the clasp to release the buckle, and strap the watch on your wrist.
④ Close the clasp first and then, the flap.
⑤ With the hand which is not wearing the watch, adjust the length of the slider so that the watch fits well around your wrist.
GRAND SEIKO STANDARD

Due to the movement (driving body) structure, normal usage accuracy of a mechanical watch varies according to differences in environmental conditions of use such as winding state of the mainspring by movement amount of the wrist per day, temperature environment, and position = orientation of a watch.

"Grand Seiko Standard" is a Grand Seiko-exclusive accuracy standard for mechanical watches, which has been established to check superior performance of Grand Seiko mechanical watches irrespective of differences in environmental conditions of use in which a watch is used.

For details of the "Grand Seiko Standard," refer to pages 34 to 35.

It is conditioned that all of Grand Seiko mechanical watches are to be passed by the "Grand Seiko Standard Inspection" according to the exacting standard. Only products, in which the movement single unit before assembly in a case is measured for gain/loss (daily rate) under various environments which are artificially controlled in the manufacturing plant for 17 days in total, and the measured values fall under the standard range, are given the title of "Grand Seiko."

For normal usage accuracy when the watch is actually used by a customer, -1 to +10 seconds (+8 seconds for Cal. 9S86 and 9S85) per day are specified as target values. To properly judge the accuracy in the case of normal usage, check gain/loss by using for a week to ten days, not only for one day, in normal use condition. If the mean value per day exceeds the above-mentioned target range, we will adjust the watch. (Adjustment is provided free of charge within three years after purchase. After the three-year period, adjustments are charged.) We will respond to the following cases at cost regardless of the period of time after purchase.

- Disorder in accuracy has occurred due to customer's carelessness such as, incorrect usage method or magnetizing the watch.
- Disorder in accuracy has occurred due to repair by another company.
- Disorder in accuracy has occurred due to natural disasters such as fire, flood or earthquake.
- Guaranteed conditions have been altered.

Grand Seiko Special Standard

The Grand Seiko Special Standard is an accuracy standard that sets even more exacting conditions than the Grand Seiko Standard.

As for a model mounted with a caliber that passes this standard inspection, as proof of passing, the logo “SPECIAL” is printed on the dial.

**Description of Grand Seiko Standard Terminology**

<table>
<thead>
<tr>
<th>Item</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Position in inspection</td>
<td>5 orientations are specified by the International Standard ISO3159 so as to carry out various kinds of tests for time keeping. In addition thereto, in the GS inspection, 12 o'clock Up position in the state where a watch taken off the wrist is placed, is added, 6 orientations are specified. (Dial Up, Dial Down, 12 o'clock Up, 3 o'clock Up, 6 o'clock Up, and 9 o'clock Up)</td>
</tr>
<tr>
<td>Mean daily rate</td>
<td>Mean value of a total of 12 daily rates measured in 6 different positions, respectively, for two days. This is a target value indicating basic gain/loss per day of a watch, however, it is required to comprehensively judge the actual accuracy performance in consideration of other items.</td>
</tr>
<tr>
<td>Mean variation</td>
<td>Mean value of a total of 6 variations of daily rates between the first day and second day when measured in 6 different positions for two days each. It indicates the degree which daily accuracy stabilizes in each position.</td>
</tr>
<tr>
<td>Maximum variation</td>
<td>Maximum value of a total of 6 variations of daily rates between the first day and second day when measured in 6 different positions for two days each. It indicates the degree which accuracy per day changes at maximum according to positions.</td>
</tr>
<tr>
<td>Difference between flat and hanging position</td>
<td>Indicates gain/loss in two positions at which a watch is most frequently used in daily life. It is a difference between mean daily rates for two days when a watch is placed in the dial Up position and mean daily rates for two days when a watch is placed in the 6 o'clock Up position.</td>
</tr>
<tr>
<td>Greatest difference between the mean daily rate and any individual rate</td>
<td>Maximum difference value between daily rates for twelve days in the test initial stage and mean daily rates. It indicates the degree at which the daily rate varies according to the manner for placing a watch.</td>
</tr>
<tr>
<td>First variation of rate per 1°C</td>
<td>Variation in daily rates per 1°C between 38°C and 8°C in the same position (Dial Up position). It indicates gain/loss in the temperature environment (taken-off state from the wrist) where a watch is used.</td>
</tr>
<tr>
<td>Second variation of rate per 1°C</td>
<td>Variation of daily rates per 1°C between 38°C and 23°C in the same position (Dial Up position). It indicates gain/loss in the temperature environment (worn state of the wrist) where a watch is used.</td>
</tr>
<tr>
<td>Rate-resumption</td>
<td>Value obtained by subtracting mean daily rates of initial two days from daily rate of the last inspection day. It indicates the degree at which daily rate stabilizes after usage for a predetermined period.</td>
</tr>
</tbody>
</table>

**Grand Seiko Standard Inspection Certificate**

- Grand Seiko Standard Inspection Certificate certifies the values of a movement single unit before assembly in a case which were measured under an artificially controlled environment in the manufacturing plant have passed the Grand Seiko Standard Inspection. The certificate is printed with the caliber number, movement serial number, and case serial number.

- Normal usage accuracy of mechanical watches varies according to respective customer conditions of use (winding state of the mainspring by movement amount of the wrist per day, temperature environment, and position (orientation of a watch). Accordingly, the actual normal usage accuracy when it is used by a customer may differ from the value of each item specified in the Grand Seiko Standard.

⚠️ **CAUTION**

The Grand Seiko Standard Inspection Certificate cannot be reissued when it has been lost. Also, it cannot be reissued after repair or adjustment.
Cautions for accuracy of mechanical watch

Mechanical watches have a mechanism that is moved by power generated when the mainspring is unwound, and small metal parts physically work together to control the accuracy. Fragile metal parts of a mechanical watch are easily influenced by external environment such as temperature, gravity, and shock. Also, conditions of use such as normal usage time and winding state of the mainspring can influence the gain/loss of the watch.

① Accuracy of mechanical watch is "mean daily rate."

Accuracy of the quartz watch is indicated monthly or annually such as a mean rate of ±15 seconds or annual rate of ±10 seconds. This indicates the degree of total difference in accuracy when the quartz watch is continuously used for a month or a year. To the contrary, accuracy of the mechanical watch is normally indicated as a "mean daily rate." Accuracy of the mechanical watch slightly varies each day as it is influenced by various conditions of use, and it is normally unstable. Then it is required to judge whether the accuracy is satisfactory or not by checking the mean values in the case of use for a week to ten days, but not for only one day. For normal use accuracy of Grand Seiko mechanical watch, -1 to +10 seconds (+8 seconds for Cal. 9S86 and 9S85) per day are specified as target values. If the mean value exceeds the abovementioned target value in the normal usage condition when the watch is used for a week to ten days, we will adjust it.

* Adjustments are provided free of charge within three years after purchase. After the three-year period, adjustments are charged. However, please note that the parts that are aged and deteriorated due to long duration of use may not be adjusted to your desired accuracy. ⇒ For details, refer to pages 32 and 37.

② Factor influencing accuracy -1: Wound amount of the mainspring

In order to use the mechanical watch at better accuracies, it is required to supply a constant strong energy wherever possible to respective parts. In the state where the mainspring is fully wound, accuracy is stable, however, when the mainspring is unwound to weaken energy to be supplied, the parts controlling accuracy tends to be externally influenced, and accuracy becomes unstable. In order to use a mechanical watch at a steady accuracy, it is recommended to use it in a condition where the mainspring is sufficiently wound.

③ Factor influencing accuracy -2: Temperature influence

Mechanical watch parts are metal which slightly elongate and contract by change in temperature, and this influences accuracy. Normally, under high temperatures, it tends to lose time, and under low temperatures, it tends to gain time.

④ Factor influencing accuracy -3: Difference by position (orientation of a watch)

Parts related to accuracy of a mechanical watch are also influenced by the earth’s gravity. For example, gain or loss differs when a watch is horizontally placed and when it is vertically placed in the 12 o’clock up position. When the watch is not worn on the wrist, accuracy errors that occur while wearing can also be compensated to some extent according to the position. Try to place it in various positions to find the position appropriate to your watch.

To preserve the quality of your watch

After-sale service

Notes on guarantee and repair

- Contact the retailer from whom the watch was purchased or Grand Seiko international service network mentioned on CERTIFICATE OF GUARANTEE or our website repair or overhaul.
- Within the guarantee period, present the certificate of guarantee to receive repair services.
- Guarantee coverage is provided in the certificate of guarantee. Read carefully and retain it.
- For repair services after the guarantee period has expired, if the functions of the watch can be restored by repair work, we will undertake repair services upon request and payment.

Replacement parts

- Please keep in mind that if original parts are not available, they may be replaced with substitutes whose outward appearance may differ from the originals.

Inspection and adjustment by disassembly and cleaning (overhaul)

- Periodic inspection and adjustment by disassembly and cleaning (overhaul) is recommended approximately once every 3 to 4 years in order to maintain optimal performance of the watch for a long time.
- The movement of this watch has a structure that consistent pressure is applied on its power-transmitting wheels. To ensure these parts work together properly, periodic inspection including cleaning of parts and movement, oiling, adjustment of accuracy, functional check and replacement of worn parts is needed. Inspection and adjustment by disassembly and cleaning (overhaul) within 3 to 4 years from the date of purchase is highly recommended for long-time use of your watch. According to use conditions, the oil retaining condition of your watch mechanical parts may deteriorate, abrasion of the parts may occur due to contamination of oil, which may ultimately lead the watch to stop. As the parts such as the gasket may deteriorate, water-resistant performance may be impaired due to intrusion of perspiration and moisture. Please contact the retailer from whom the watch was purchased for inspection and adjustment by disassembly and cleaning (overhaul). For replacement of parts, please specify “GRAND SEIKO GENUINE PARTS". When asking for inspection and adjustment by disassembly and cleaning (overhaul), make sure that the gasket and push pin are also replaced with new ones.
- When your watch is inspected and adjusted by disassembly and cleaning (overhauled), the movement of your watch may be replaced.

**Guarantee**

Within the guarantee period, we guarantee free repair/adjustment service against any defects according to the following guarantee regulations, provided that the watch was properly used as directed in this instruction booklet.

**Guarantee coverage**
- The watch body (movement, case) and metallic band.

**Exceptions from guarantee**
In following cases, repair/adjustment services will be provided at cost even within the guarantee period or under guarantee coverage.
- Exchange of leather, Silicone, or fabric band.
- Troubles or damage to the case, glass, or band, caused by accidents or improper usage.
- Scratches or grime caused by use.
- Troubles and damage caused by acts of God, natural disasters including fire, floods or earthquakes.
- Text in certificate has been altered.
- No certificate is presented.

**Procedure to claim free repair services**
- For any defects under guarantee, submit the watch together with the attached certificate of guarantee to the retailer from whom the watch was purchased.
- In the case where you cannot accept the guarantee from the retailer from whom the watch was purchased due to gift-giving or relocation, etc., ask Grand Seiko international service network mentioned on CERTIFICATE OF GUARANTEE or our website by attaching the certificate without fail.

**Others**
- For the watch case, dial plate, hands, glass, band etc., some alternative parts may be used for repair if necessary. Refer to page 37 of this booklet for retention period of the parts.
- For length adjustment service of metallic band, ask the retailer from whom the watch was purchased or Grand Seiko international service network mentioned on CERTIFICATE OF GUARANTEE or our website. Other retailers may undertake the service on a chargeable basis or may not undertake the service.
- Free repair services are guaranteed only under the period and conditions specified in the certificate of guarantee. It does not affect specific legal rights of a consumer.

**Daily care**

**The watch requires good daily care**
- Do not wash the watch when its crown is at the extended position.
- Wipe away moisture, sweat or dirt with a soft cloth.
- After soaking the watch in seawater, be sure to wash the watch in clean pure water and wipe it dry carefully.

※ If your watch is rated as "non-water resistant" or "water resistant for daily use", do not wash the watch.
⇒ "The case back shows the caliber and performance of your watch" page 10.
⇒ "Water resistance" page 10.

**Turn the crown from time to time**
- In order to prevent corrosion of the crown, turn the crown from time to time.
- The same practice should be applied to a screw lock type crown.
  ⇒ “Crown” page 17.
The band touches the skin directly and becomes dirty from sweat or dust. Therefore, lack of care may accelerate deterioration of the band or cause skin irritation or stain on the sleeve edge. The watch requires a lot of attention for long usage.

**Metallic band**
- Moisture, sweat or soil will cause rust even on a stainless steel band if they are left for a long time.
- Lack of care may cause a yellowish or gold stain on the lower sleeve edge of shirts.
- Wipe off moisture, sweat or soil with a soft cloth as soon as possible.
- To clean the soil around the joint gaps of the band, wipe it out in water and then brush it off with a soft toothbrush (Protect the watch body from water splashes by wrapping it up in plastic wrap etc.).
- Because some titanium bracelets use pins made of stainless steel, which has outstanding strength, rust may form in the stainless steel parts.
- If rust advances, pins may poke out or drop out, and the watch case may fall off the bracelet, or the clasp may not open.
- If a pin is poking out, personal injury may result. In such a case, refrain from using the watch and request repair.

**Leather band**
- A leather band is susceptible to discoloration and deterioration from moisture, sweat and direct sunlight.
- Wipe off moisture and sweat as soon as possible by gently blotting them up with a dry cloth.
- Do not expose the watch to direct sunlight for a long time.
- Please take care when wearing a watch with light-colored band, as dirt is likely to show up.
- Refrain from wearing a leather band watch other than Aqua Free bands while bathing, swimming, and when working with water even if the watch itself is water-resistant enforced for daily use (10-BAR/20-BAR water resistant).

**Silicone band**
- As for material characteristics, the band is easily dirtied, and may be stained and discolored. Wipe off dirt with a wet cloth or cleaning tissue.
- Unlike bands of other materials, cracks may result in the band being cut. Take care not to damage the band with an edged tool.

**Notes on skin irritation and allergy**
Skin irritation caused by a band has various reasons such as allergy to metals or leathers, or skin reactions against friction on dust or the band itself.

**Notes on the length of the band**
Adjust the band to allow a little clearance with your wrist to ensure proper airflow. When wearing the watch, leave enough room to insert a finger between the band and your wrist.
If your watch has Lumibrite

Lumibrite is a luminous paint that is completely harmless to human beings and the natural environment; containing no noxious materials such as radioactive substance. Lumibrite is a newly-developed luminous paint that absorbs light energy of the sunlight and lighting apparatus in a short time and stores it to emit light in the dark. For example, if exposed to a light of more than 500 lux for approximately 10 minutes, Lumibrite can emit light for 3 to 5 hours.

Please note, however, Lumibrite emits the light it stores, the luminance level of the light decreases gradually over time. The duration of the emitted light may also differ slightly depending on such factors as the brightness of the place where the watch is exposed to light and the distance from the light source to the watch.

※ In general, when you enter a dark place from a bright environment, your eye cannot adapt to the change in light levels quickly. At first, you can hardly see anything, but as time passes, your vision gradually improves. (Dark adaptation of the human eye)

Reference data on the luminance

</thead>
<tbody>
<tr>
<td>The watch stops operating.</td>
<td>The mainspring has not been wound.</td>
<td>Wind the mainspring or swing the watch for a few times so that the watch will start operating. If this action does not correct the condition, consult the retailer from whom the watch was purchased.</td>
</tr>
<tr>
<td>The watch temporarily gains/loses time.</td>
<td>The watch has been left in extremely high or low temperatures for a long time.</td>
<td>Normal accuracy will resume when the watch returns to normal temperature.</td>
</tr>
<tr>
<td>The watch was brought into close contact with a magnetic object.</td>
<td></td>
<td>Accuracy cannot be recovered. Consult the retailer from whom the watch was purchased.</td>
</tr>
<tr>
<td>The watch was dropped, worn while playing active sports, hit against hard surfaces, or exposed to strong vibrations.</td>
<td></td>
<td>Accuracy cannot be recovered. Consult the retailer from whom the watch was purchased.</td>
</tr>
<tr>
<td>The date changes during daytime.</td>
<td>A.m./p.m. is not correctly set.</td>
<td>Advance the hour hand for 12 hours and reset the time and date.</td>
</tr>
<tr>
<td>Blur in the display persists.</td>
<td>Small amount of water has got inside the watch due to deterioration of the gasket, etc.</td>
<td>Consult the retailer from whom the watch was purchased.</td>
</tr>

Mean daily rate* is a mean value of daily rates in a condition where the movement before assembly in a case are measured in 6 positions in a fixed manner under artificially controlled environment for 12 days. Caution: Depending on conditions of use such as normal usage time, temperature environment, and winding state, accuracy may exceed the abovementioned range. Therefore, for normal usage accuracy when it is actually used, -1 to +10 seconds (-1 to +8 seconds for Cal. 9S86 and 9S85) per day are specified as target values. ※ The specifications are subject to change without prior notice due to product improvement.
